If you've downloaded and tried to use the many available versions of the WDS system on the Internet, you may have encountered difficulties in being able to access the actual wiring diagrams. We have gone through and modified the entire system to work with modern browsers, and can guide you on setting up your system for the one specific component we cannot change, the Java runtime. With the internet version it does no matter what operating system you are running, or what platform you are operating upon. Windows, Macintosh, Linux As long as your chosen browser supports Java properly and the Java Runtime is installed appropriate for your operating system and the browser can display SVG Scaled Vector Graphics then it should work. Now there are some logical limits. Display sizes less than x are going to be unusable so your smart phone is probably not a good choice. But tablets should be Okay if they otherwise meed the technical requirements. Note that running Java applets it the most difficult process to enable for non-Windows tablets. The following is a quick test to see if your existing browser is ready to run the wiring diagram system. On a system that you use daily and access the internet often, you should keep your Java Runtime up to date with the latest updates. However, if you will be using the computer for diagnostics only, and it does not already have a JRE installed, you can use the Java 6. This version is old enough that it does not have the same security or systems protections that versions from JRE 7. We have saved the JRE file to our secure storage location where it is stored in an encrypted form so we can be sure it doesn't get modified before you download it. If you have an up to date system, then you will need to modify the Security Settings for your Java

Runtime to add this website to your list of exceptions allowed to run unsigned code. This is required by the Java Runtime Environment when:. Which pretty well describes the Java applet that the WDS system uses and is key to its operation! The instructions following come from the Oracle web site. If the RIA requires resources from another domain, that domain must also be included in the exception site list. Otherwise, the RIA is blocked when the additional resource is accessed. The exception site list is managed in the Security tab of the Java Control Panel. The list is shown in the tab. To add, edit, or remove items from the list, click Edit Site List and follow the directions below. If an invalid URL is entered, an error icon is shown next to the item. When you open the specific model page in the WDS and you are using a version of Java greater than 7, you will see at the very least depending upon your specific Java configuration and security settings a prompt by the Java Security Settings with a pop-up warning stating: "Do you want to run this application? Click the "Run" button to load the Java applet that allows access to the wiring diagrams. It is important to note that the WDS System is not mobile friendly. The minimum screen resolution for the diagrams is x , x for the selection screen, and only some mobile browsers may render the images properly if they properly support Java applets. If you are interested in your own copies of these DVD's we can provide that for a nominal charge. Because the original BMW DVD's will not run 'as delivered' on modern computer systems, we have modified the appropriate programs to allow them to run on current PC's with minimal changes to your system. All must have Internet Explorer! The only non-functional operation is clicking links in the diagram to open the appropriate tree link for the component; online the links will work in Internet Explorer 5. The funtional links issue does NOT apply to our DVD version, with this, all the code has been modified to correctly function on any supported Windows version, with Internet Explorer from 8 onwards. Java Runtime: On a system that you use daily and access the internet often, you should keep your Java Runtime up to date with the latest updates. All provided in a complete, functional, works every time, package that includes correctly configuring the host computer for ANY supported diagnostic interface. This system works with all BMW "E-Series" models from if equipped for the newer system through Model year vehicles - for the "Dealer" tools, and from same through For Mini's this system works with all "R-Series" Mini's from - when using the "Dealer" tools, and for the factory tools all "R-Series" Mini's though You provide a laptop, notebook or desktop with a reasonably clean copy of Windows, and this system will connect to your car and work the first time, and every time. While we have made the installation painless, we have also made using the tools much easier too. The files are pre-configured to print to a PDF file, and then are saved to your host computer for later review or printing since most of us do not have printers near our cars. Note that if you are using a factory BMW diagnostic head, printing through the virtual network does not work as the machines physical network is used. Included are utility programs to configure the system to use whichever diagnostic interface you need. It will recognize both standard Serial Ports built into the machine, and those virtual serial ports created by the FTDI installation. When you are using a USB cable, there are special utilities used to configure the cable and that only need to be run one time per USB cable as well the Cable Select utility that will configure the system. There are a couple of limitations to using a serial ADS cable that you should be aware of. We have had very mixed results in success with this generally we believe it will not work. On your selected notebook or laptop or desktop, install the appropriate version of VMware player free from VMware for non-commercial use or if you already have your own copy of VMware workstation

, it must be no older than 6. How does it install? Well unlike all the other ebay offerings, there are no complicated instructions including things like ' change this setting in your Windows to make this program work. Complete instructions are provided, and support should you need it is readily available by email, phone or using TeamViewer TeamViewer is included on the DVD and in the download installation. A DVD or a down-loadable installer with the custom installation which includes the following software:. Any version claiming to be newer such as one vendors SSS v63 I saw recently is using data that was hacked into the system. This download if you choose the whole package requires up to an additional 45 GB of disk space to install on top of the existing system. Unless using a factory DK diagnostic multiplexer. This means we still strongly suggest using the older serial ADS cables. Click here for information on Rolls-Royce version. EZCableSelect showing selection options X. Go to top.
